# S1 R-PDLF and SDROSS experiments

Figure S1: (A) Chemical structure of POPE with the labeling of headgroup and glycerol backbone carbons. (B) INEPT spectra from POPE sample with the headgroup and glycerol backbone peaks labeled. (C) 2D R-PDLF spectra (D) Dipolar sliced from the 2D R-PDLF spectra with the resulting order parameters on top of figures. (E) Experimental S-DROSS curves giving signs of the order parameters.

1.A, B etc. labels to be put in the figure.

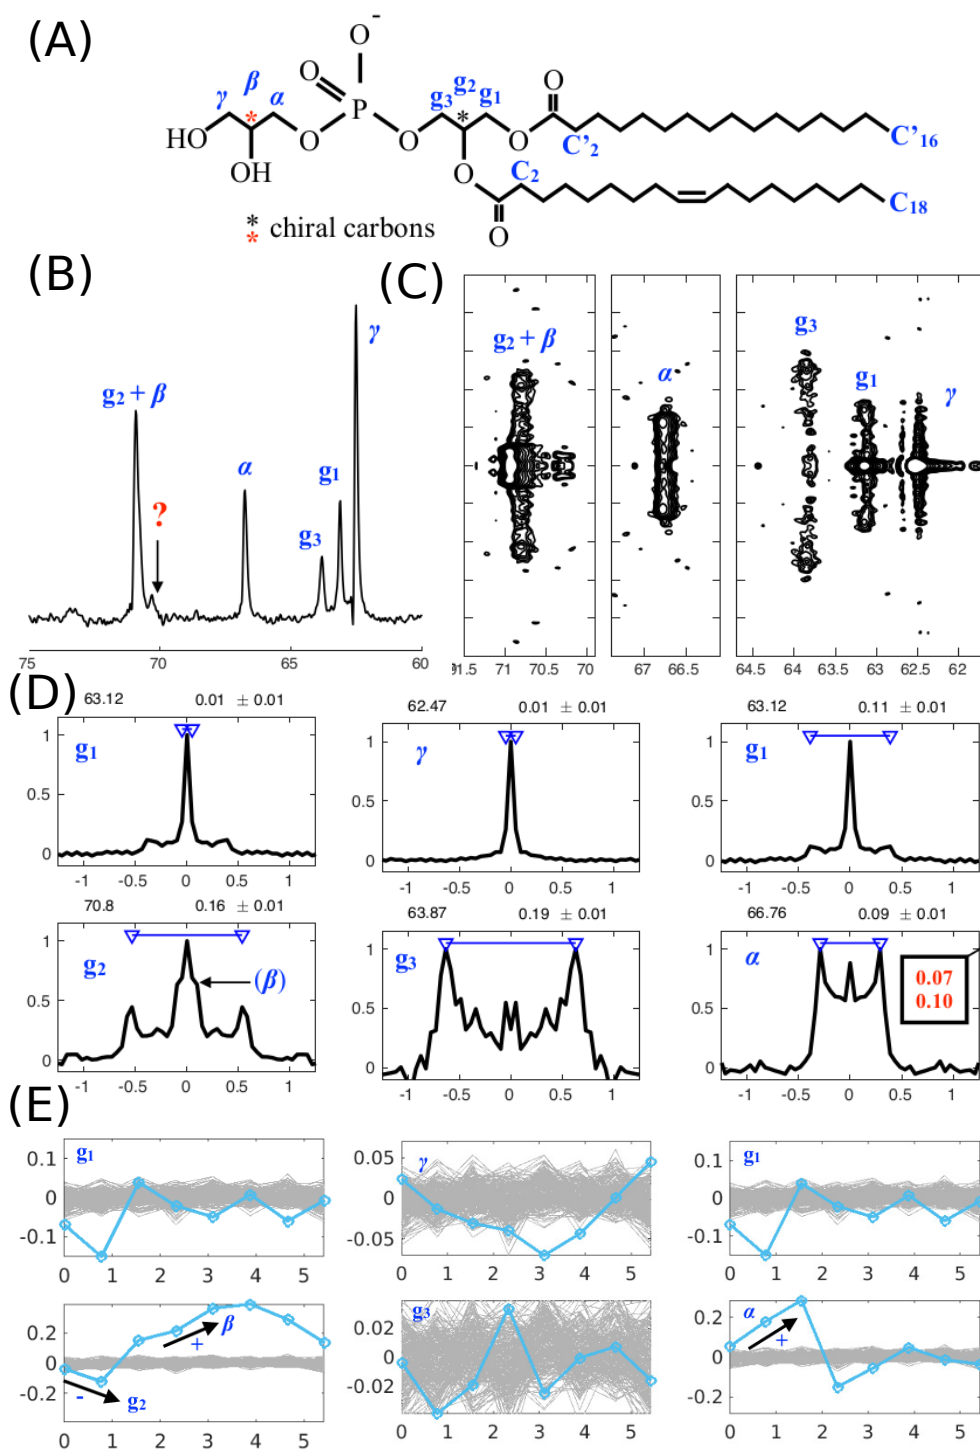

Figure S2: (A) Chemical structure of POPG with the labeling of headgroup and glycerol backbone carbons. (B) INEPT spectra from POPG sample with the headgroup and glycerol backbone peaks labeled. (C) 2D R-PDLF spectra (D) Dipolar sliced from the 2D R-PDLF spectra with the resulting order parameters on top of figures. (E) Experimental S-DROSS curves giving signs of the order parameters.

Figure S3: Simpson simlaton of S-DROSS curve of  $\beta$ -carbon of POPG.

## **S2 Comparison of headgroup order parameters from different force fields to experiments**

The quality of PE and PG headgroup conformational ensembles in different simulations against NMR experiments is evaluated in figures S4 and S5 using C-H bond order parameters as in our previous studies for PC and PS lipids.<sup>1,2</sup> Conclusions are the same for all lipids: None of the force fields correctly captures the lipid headgroup conformational ensembles, but CHARMM36 gives results closest to experiments.

The PG headgroup is biologically abundant R enantiomer in all simulations, while our <sup>13</sup>C NMR experiments has a racemic mixture. Nevertheless, previous <sup>2</sup>H NMR experiments comparing results between different enantiomers concluded that the structural differences between these are minor.<sup>3</sup>

Figure S4: The headgroup and glycerol backbone order parameters of PE lipids from experiments (POPE and signs this work, DPPE from Ref. 4 and E.coliPE from Ref. 5) and simulations with different force fields.

2.This should be clarified as in NMRLipidsI and error bars should be added. Probably larger error bars for united atom models based on the report by Fuchs et al.

3.Lipid17 data should be updated to the one with correct dihedrals reported here

<https://github.com/NMRLipids/NMRLipidsIVPEandPG/issues/12#issuecomment-756641407>

Figure S5: The headgroup and glycerol backbone order parameters of PG lipids from experiments (POPG and signs from this work and from Ref. 6, DPPG with 100mM NaCl from Ref. 3, and E. Coli PG results from Ref. 5) and simulations with different force fields.

4. Lipid17 data should be updated to the one with correct dihedrals reported here

<https://github.com/NMRLipids/NMRLipidsIVPEandPG/issues/12#issuecomment-756641407>

### S3 PC headgroup in mixtures with PE or PG lipids

Headgroup order parameters of PC lipids are unchanged upon addition of zwitterionic lipids or cholesterol in experiments, but increase upon addition of negatively charged PG or PS lipids because headgroup dipole tilts more parallel to the membrane plane after incorporation of negative charges into the membrane.<sup>7,10,11</sup> The response of PC headgroup order parameters to the addition of PE or PG lipids from different simulations is compared with experiments in figure S6. None of the simulations reproduce neither the experimentally observed increase in PC headgroup order parameters with increasing amount of PG nor the related tilting of the headgroup more parallel with the membrane. Similar observations in our previous work for PS lipids were explained by the overestimated counterion binding affinity that neutralizes the effect of added negative charge.<sup>2</sup> All simulations except Berger-OPLS predict tilting of P-N headgroup outwards from the membrane and decrease of PC headgroup order parameters upon addition of PE lipids. These results are not in line with experiments where the PC headgroup order parameters are not affected by zwitterionic lipids.<sup>7</sup> The good performance of Berger-OPLS simulations in here is surprising because headgroup conformational ensemble is not very close to experiments in this model and the response of headgroup order parameters to cholesterol was significantly overestimated by the Berger/Höltje force field in our previous work.<sup>1</sup>

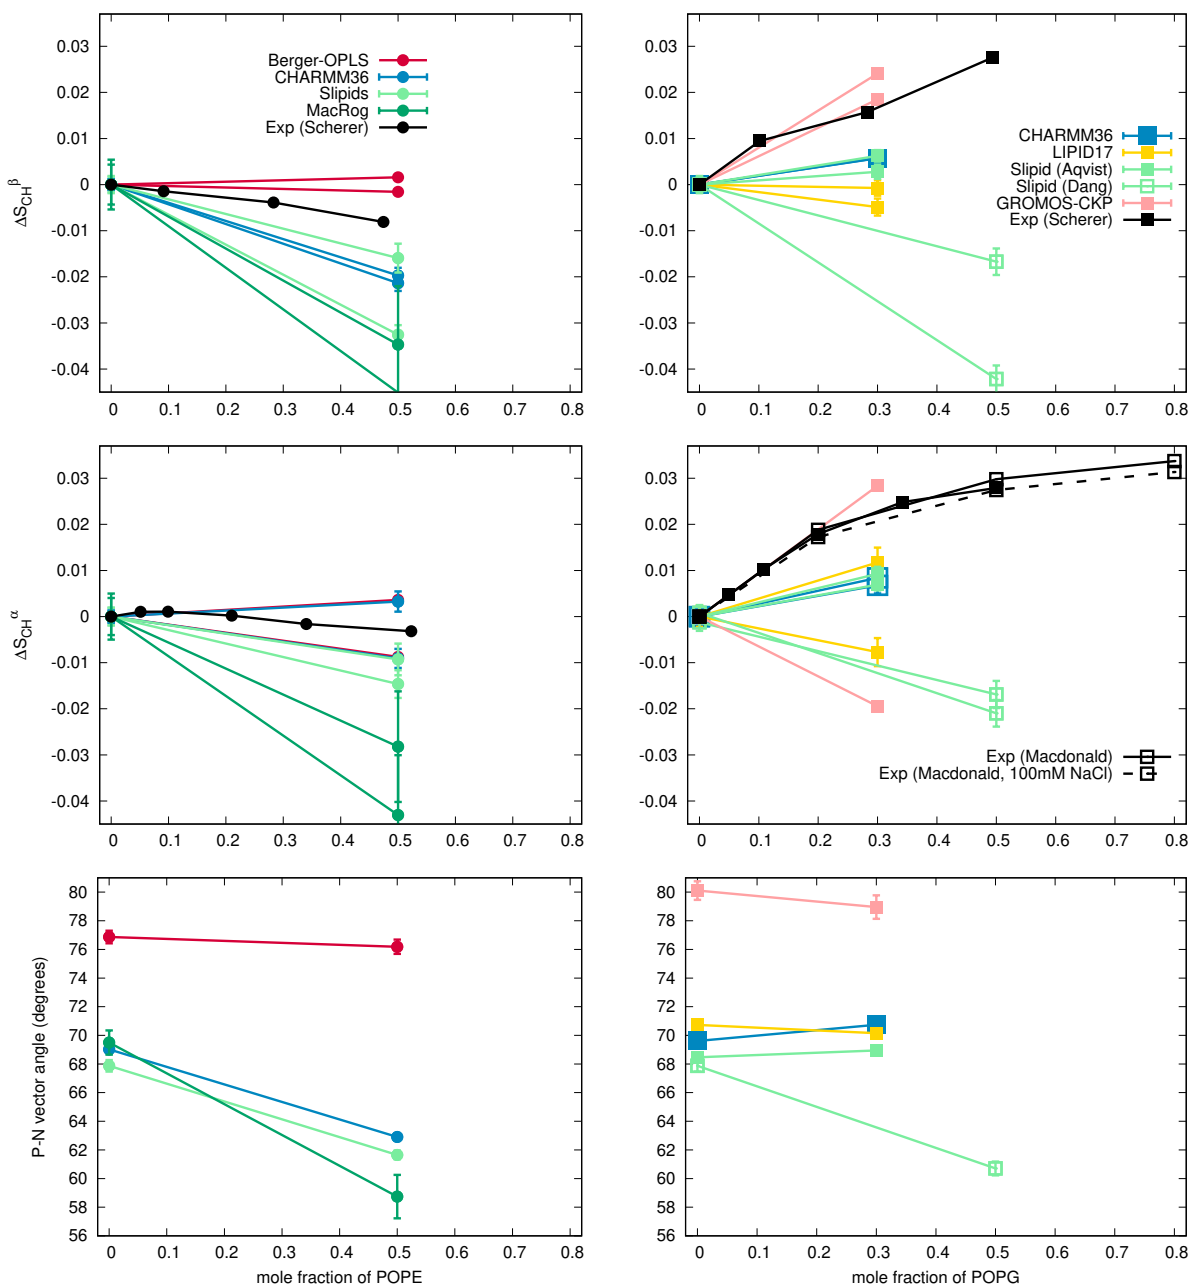

Figure S6: Modulation of POPC headgroup order parameters with increasing amount of POPE (left) and POPG (right) in bilayer from experiments at 298 K<sup>7,8</sup> and simulations with different force fields (temperatures listed in tables S3 and S4 are between 298-310 K). Signs are determined as discussed in Refs. 1,9.

## S4 PG headgroup in mixtures with PC lipids

Changes in other than PC lipid headgroup with changing membrane composition are less extensively characterized in the literature. The  $\beta$ -carbon order parameter in PG headgroup increases mildly<sup>8</sup> or is unchanged<sup>6</sup> upon increasing amount of PC lipids (Fig. S7), but experimental data from  $\alpha$ -carbon is not available. Also the tested force fields predict very small changes for the  $\beta$ -carbon order parameter, while the P-N vector tilt and its response to the increased amount of PC varies significantly between force fields in figure S7. Therefore, more experimental data and more accurate force fields are still required to resolve the PG conformational ensembles in mixtures with other lipids.

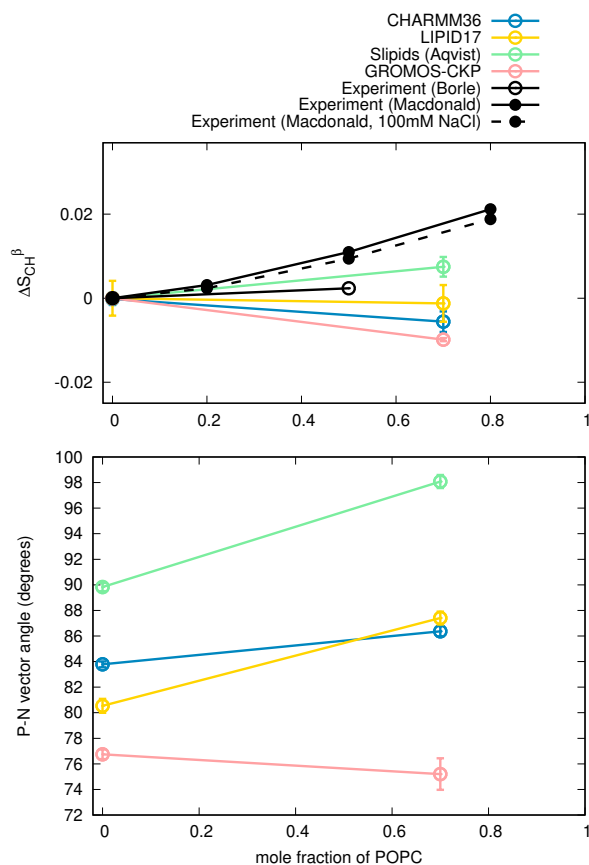

Figure S7: Modulation of PG lipid headgroup order parameters with the increasing amount of PC in lipid bilayer from experiments at 298 K<sup>6,8</sup> and simulations with different force fields at 310 K.

## S5 Calcium binding to POPC:POPG mixtures

The changes of headgroup order parameters in POPC:POPG mixtures upon addition of  $\text{CaCl}_2$  between different simulations and experiments<sup>6,8</sup> are compared in figures S8 (molar ratio 1:1) and S10 (molar ratio 4:1). The results are in line with our previous studies: most force fields overestimate the calcium binding,<sup>2,12</sup> but CHARMM36 with the NBfix correction underestimates the binding affinity,<sup>2</sup> and the implicit inclusion of electronic polarizability using the electronic continuum correction (ECC) improves the results.<sup>13,14</sup>

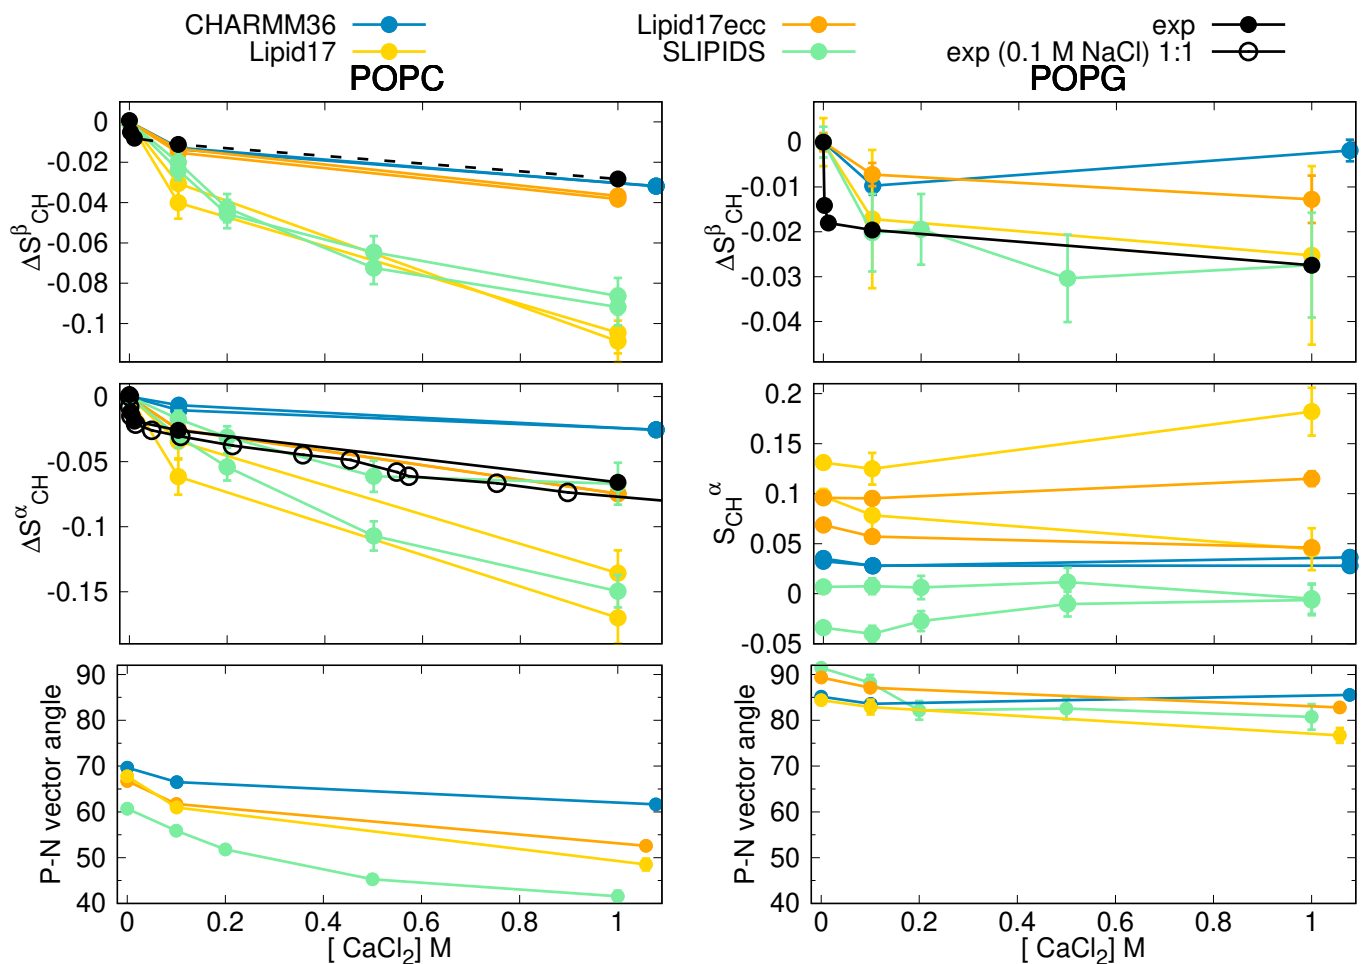

Figure S8: Modulation of headgroup order parameters of POPC (*left*) and POPG (*right*) in POPC:POPG (1:1) mixture upon addition of  $\text{CaCl}_2$  in 298 K temperature from experiments<sup>6,8</sup> and simulations. The  $\beta$ -carbon order parameter of POPC (dashed line on top left) is not directly measured but calculated from empirical relation  $\Delta S_\beta = 0.43\Delta S_\alpha$ .<sup>15</sup> The changes with respect to the systems without  $\text{CaCl}_2$  are shown for other data than for the  $\alpha$ -carbon of POPG for which experimental order parameter is not available. Calcium density distributions are shown in figure S9.

Figure S9: Calcium ion density profiles along membrane normal from simulations of POPC:POPG (1:1) mixtures with different force fields. The changes in the order parameters upon addition of  $\text{CaCl}_2$  are compared with experiments in figure S8 in the main text.

Figure S10: Modulation of headgroup order parameters of POPC (*left*) and POPG (*right*) in POPC:POPG (4:1) mixture upon addition of  $\text{CaCl}_2$  in 298 K temperature from experiments<sup>8</sup> and simulations. The changes with respect to the systems without  $\text{CaCl}_2$  are shown for other data than for the  $\alpha$ -carbon of POPG for which experimental order parameter is not available.

5. There is something wrong the Lipid17ecc data at 1M, a new simulation is coming.

Figure S11: Calcium ion density profiles along membrane normal from simulations of POPC:POPG (4:1) mixtures with different force fields.

6.Density profiles from Lipid17ecc data will be added when we have the new simulations at 1M.

## S6 Changes in headgroup conformations upon addition of $\text{CaCl}_2$

Figure S12: Changes in POPC lipid17ecc dihedrals with increasing amount of  $\text{CaCl}_2$ .

Figure S13: Changes in POPC CHARMM36 dihedrals with increasing amount of  $\text{CaCl}_2$ .

Figure S14: Changes in POPG Slipids dihedrals with increasing amount of  $\text{CaCl}_2$ .

Figure S15: Changes in POPG lipid17 dihedrals with increasing amount of  $\text{CaCl}_2$ .

## S7 Simulated systems

### S7.1 CHARMM36

*POPE* [29.Simulation details by M. Javanainen.](#)

**27. Citation and description for "Berger" model?**

**28. Upcoming Lipid17ecc with POPC:POPS (4:1) mixture simulations to be added.**

*POPC:POPG mixture with additional NaCl* 43.Simulation details by A. Peon. I have assumed that ion parameters are default Slipids, i.e., Åqvist, please correct if this is not true.

*POPC:POPG mixture with additional CaCl* 44.Simulation details by M. Javanainen.

## S7.4 Berger

*POPE* Data is available at.<sup>37,38</sup> 45.Simulation details by T. Piggot.

*DOPE* Data is available at.<sup>39,40</sup> 46.Simulation details by T. Piggot.

*POPC:POPE, POPC:DOPE and DOPC:DOPE mixtures* Data is available at.<sup>94,95</sup> 300 K with v-rescale (tau=0.1 ps), 1 bar with PR semiisotropic (tau=4 ps, compressibility=4.5e-5 bar<sup>-1</sup>), PME order 4 and space 0.12, rcoulomb and rvdw 1.0, 128 lipids per leaflet, no ion 47.Simulation details by Fuchs et al.

## S7.5 GROMOS 43A1-S3

*POPE* Data is available at.<sup>31</sup> 48.Simulation details by T. Piggot.

## S7.6 OPLS-UA

*POPE* Data is available at.<sup>33</sup> 49.Simulation details by T. Piggot.

*POPE with vdW interaction in H* Data is available at.<sup>32</sup> 50.Simulation details by T. Piggot.

## S7.7 GROMOS-CKP and GROMOS-CKPM

*POPE* Data is available at.<sup>27</sup> 51.Simulation details by T. Piggot.

*DOPE* Data is available at.<sup>30</sup> 52.Simulation details by T. Piggot.

*DPPE* Data is available at.<sup>26</sup> 53.Simulation details by T. Piggot.

*POPG* 54.Simulation details by A. Peon.

*POPC:POPG mixture* 55.Simulation details by A. Peon.

## S7.8 OPLS-MacRog

*POPE* 56.Simulation details by M. Javanainen and P. Fuchs.

*POPC:POPE mixtures* 57.Simulation details by P. Fuchs.

## S7.9 Lipid17

*POPE* 58.Simulation details by A. Peon.

*POPG* 59.Simulation details by A. Peon.

*POPC:POPG* 60.Simulation details by S. Virtanen or O. H. S. Ollila.

## S7.10 Lipid17ecc

61.This is to be finished and POPC:POPG mixtures to be described In ECC-lipid models, electronic continuum correction (ECC) is applied to implicitly include the missing electronic polarizability into the force field description.<sup>13?</sup> In practise, this is implemented by scaling the charges and Lennard-Jones  $\sigma$ s of headgroup, glycerol backbone, and carbonyl regions of Amber Lipid14/17 models are scaled by constant factors. Here, we follow the approach that previously improved ion binding to bilayers containing negatively charged PS lipids:<sup>?</sup> ECC-POPC parameters (scaling factors  $f_q=0.8$  and  $f_\sigma=0.89$  applied to Lipid14 POPC parameters)<sup>13</sup> were used for POPC and scaling factors of  $f_q=0.75$  and  $f_\sigma=0.89$  were applied to the charges and Lennard-Jones  $\sigma$ s of headgroup, glycerol backbone, and carbonyl regions of Amber Lipid17 POPG parameters. The Lipid17 parameters (described above) and initial configurations were taken from Ref.<sup>54</sup> with the correct dihedral type, and the resulting parameters are available from Ref. ? . ECC-ion parameters with the scaled charges,<sup>85-87</sup> downloaded from [bitbucket.org/hseara/ions/src/master/](http://bitbucket.org/hseara/ions/src/master/), were used in these simulations.
